

APPLICATION

Condensate removal pumps of Ks type are intended for the feed of the backpressure steam condensate of stationary steam turbines, of the condensate of heating steam from heat exchanges with the temperature up to 125°C, for pumps Ks32-150 and Ks80-155 - with the temperature up to 160°C.

The distinguishing characteristics of the condensate removal pumps are their good suction capabilities. According to the structural criterion the condensate removal pumps, depending on the place of their installation in the power block, can be of I or II rises.

DESCRIPTION

According to the structural criterion the condensate removal pumps, depending on the place of their installation in the power block, can be of I or II rises.

The pumps of I rise are subdivided into groups:

- horizontal, single-case, spiral type pumps, with one side intake;
- horizontal split, single-case pumps;
- vertical split, double-case pumps (KsV).

The pumps of II rise are single-stage, of spiral type, with the wheel of dual intake (horizontal and vertical). They are intended for the feed of the condensate with the temperature up to 60°C to deaerators of nuclear and heat power plants. They are used for pumping the condensate in steam networks of power plants.

To find out technical characteristics of the model you need, just click on the mark of the pump

They are intended for the feed of the condensate with the temperature up to 60° C to deaerators of nuclear and heat power plans. They are used for pumping the condensate in steam networks of power plants.

Flow, m ³ /h	90
Head, m	220
Frequency, Hz	49
Frequency, rpm	2940
Power, kWt	110
Height of self-suction, m	-

Condensate removal pumps of KStype are intended for the feed of the back-pressure steam condensate of stationary steam turbines, of the condensate of heating steam from heat exchangers with the temperature up to 125° C, for pumps Ks32-150 and Ks80-155 - with the temperature up to 160° C.

The distinguishing characteristics of the condensate removal pumps are their good suction capabilities.

According to the structural criterion the condensate removal pumps, depending on the place of their installation in the power block, can be of I or II rises. The pupms of I rise are subdivided into group:

- horizontal, single-case, spiral type pumps, with one-side intake.
- horizontal split, single-case pumps.
- vertical split, double-case pumps (KsV).

The pumps of II rise are single-stage, of spiral type, with the wheel of dual intake (horizontal and vertical). They are intended for the feed of the condensate with the temperature up to 60° C to deaerators of nuclear and heat power plans. They are used for pumping the condensate in steam networks of power plants.
